(a) address contrast
address bits ($\kappa = b - 1$)
A_1
A_2
read A, then Z_A
Z_1
Z_2
Z_3
Z_4
data bits ($D = 2^\kappa$), $d = Z_A$
(b) path guessing
X_1
X_2
X_3
X_4
X_5
X_2
X_6
draw $S = \{1, 3, 2\}$ w.p. q_S; return t/q_S if the path completes in S, else 0
(c) binary pointer tree, $b = L + 1$
pointer bits (L levels)
Z_v
$B_L = Z$ at the leaf reached by following the pointer bits
